

Phase - 10 - People

SOC Analyst (L1)

Anything detected by the security solution who pass through these analysts first. These are the first responders to any detection. SOC L1 Analysts perform basic alert triage to determine if a specific detection is harmful. They also report these detection through proper channels.

SOC Analyst (L2)

While Level 1 does the first level analysis, some detection require deep investigation. L2 Analysts help them dive deeper into the investigations and correlate the data from multiple data sources to perform a proper analysis.

SOC Analyst (L3)

L3 analysts are experienced professionals who proactively look for any threat indicators and support in the incident response activities. The critical severity detection reported by L1 and L2 are often security incidents that need detailed responses, including containment, eradication and recovery. This is where L3 Analysts experience comes in handy.

Security Engineer

All Analysts work on security solutions. These solutions need deployment and configuration. Security engineers deploy and configure these security solutions to ensure their smooth operation.

Detection Engineer

Security rules are the logic built behind security solutions to ensure their smooth operation and detect harmful activities. L2 and L3 often create these rules, while the SOC team can sometimes also utilize the detection Engineer role independently for this responsibility.

SOC Manager

The SOC manager manages the process which SOC team follows and provides. The SOC Manager also remains in contact with the CISO (Chief Information Security officer) and provide him updates on the SOC team's current security posture and efforts.
