

Types of Organizational Data

1. Traditional Data :

Traditional data is typically generated and maintained by all organizations, big and small. It includes the following:

- Transactional data such as details relating to buying and selling, production activities and basic organizational operations such as any information used to make employment decisions.
- Intellectual property such as patents, trademarks and new product plans, which allows an organization to gain economic advantage over its competitors. This information is often considered a trade secret and losing it could prove disastrous for the future of a company.
- Financial data such as income statements, balance sheets and cash flow statements, which provide insight into the health of a company.

2. Internet of Things (IoT) and Big Data :

IoT is a large network of physical objects, such as sensors, software and other equipment. All of these 'things' are connected to the Internet, with the ability to collect and share data. And given that storage options are expanding through the cloud and virtualization, it's no surprise that the emergence of IoT has led to an exponential growth in data, creating a new area of interest in technology and business called 'Big Data.'
